Learning Objectives

By the end of this session, you will understand:

- What are Criteria
- Who manages Criteria
- · How can Criteria be Created/Modified

Criteria

 Criteria is a condition or conditions on which a Rule is based. Sentinel triggers an action only when the criteria for the Rule has been satisfied.

Criteria

- In the Sentinel Rules Engine, rules are composed of Criteria.
- An action is triggered only when the Criteria specified for the Rule has been satisfied.
 - Features of Criteria:
 - · Can be created and modified by the client
 - Has an entity, attribute, logical operator, and a value to compare with
 - · Can be created with a single value or range of values
 - Single value = Static
 - Range of Values = Reference Table
 - Any number of criteria can be assigned to a single Rule.

Understanding the Elements of Criteria

Elements of Criteria:

- Criteria Title
- Criteria Description
- Rule Type
- Criteria Type
- Entity
- Entity Attribute
- Operator

- Rule Type: Defines if the Rule is Constraint Satisfaction or Identification.
 - Constraint satisfaction rules: run on a single episode or single member.
 - Identification rules: run against the entire member population or episodes in Jiva.
 SRE acts as a search engine identifying and listing the entities based on the search criteria.

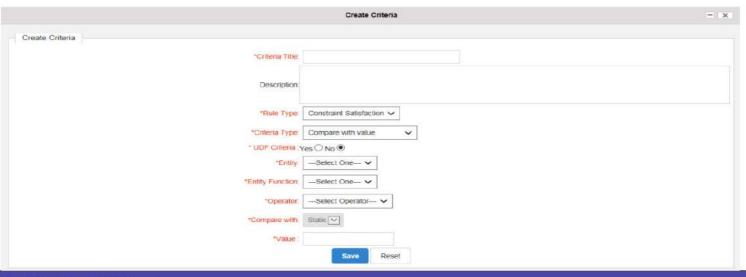

- Criteria Title is a free text field that allows the user to label the Criteria being created.
- It is important to maintain uniformity when creating the title.
 - Example: Entity + Attribute + Operator + Value
 - Member Age greater than 25
- <u>Criteria Description</u> allows the user to provide a brief description of the Criteria being created in a free text format.

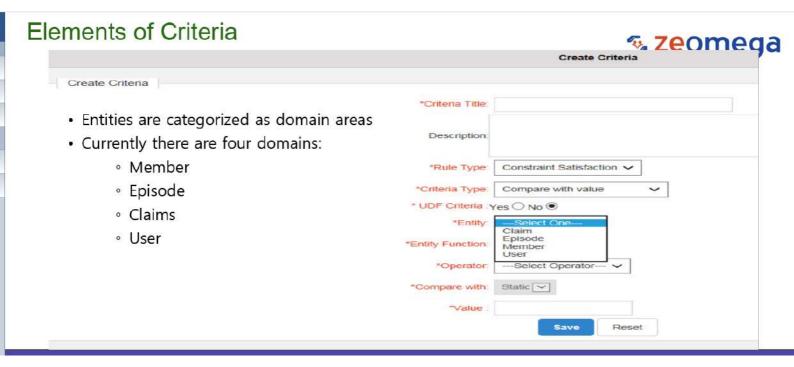

- · Available Criteria Types include:
 - Compare with Value Compares the value entered with the current static value
 - True/False Criteria is evaluated as being true or false
 - · Date/Time Comparison uses a Date/Time comparison for a look back period
 - Look up in Decision Table Compares the value with the value provided in the Decision Table, used with a unique combination of values
 - Look up in Reference Table Compares the value with the value in the Reference Table, used when a range of values is provided

• Depending on the Criteria Type selected, additional fields will appear.

Copyright 2020 ZeOmega. All Rights Reserved

• An Operator must be selected to validate the criteria.

Criteria Type	Operator values
Compare with value	=, <=, >=, !=, <, >, In, not in, like, not like, between
True False	No Operator
Custom	No Operator
Date/Time Comparison	Between
Look up in Reference Table	Exists in
Look up in Decision Table	=, !=, >, >=, <, <=, cell_op, cell_op_logical
